Dear Jonathan,

I am a CTO who still writes code. I run the technical side of an AI consulting practice, which means I own the architecture, build the agentic workflows, and carry them to production. Your posting asks for a leader who owns technology end to end, sets the direction, and stays hands-on writing and reviewing code as needed. That is the job I do now, and it is the one I want to do at scale.

EstateSpace is at the moment I like best. You have real customers, fast growth, and a multi-tenant platform ready for its next phase. Designing an AI-native architecture that lets a lean team ship continuously is exactly where I work. Lily is the right instinct: let people manage by exception instead of chasing updates. I hold a strong opinion that AI done fast is not the same as AI done well. The team that ships AI slop loses to the team that ships judgment, and a platform holding wealthy families' private records has no room for the former.

Here is what I would bring. At Pipeline 360 I shipped a revenue-critical, multi-tenant platform on AWS from zero to production in under 90 days, protecting an 8-figure revenue line without loosening security or reliability. At Industry Dive I grew one team of eight into five cross-functional teams of forty across time zones, standing up SRE, observability, automated CI/CD, and incident response that cut time-to-ship 35%. I also drove AI-native development across an 800-plus employee org by turning loose scripts into an evaluated, guardrailed platform teams trusted. Owning architecture, infrastructure, security, and AI strategy at once is familiar ground.

I would welcome a conversation about where you want the platform and the team to go next.

Sincerely,
Chris Monnat
